CO Arabidopsis thaliana (Mouse-ear cress).

CO Eukaryota, Viridiplantae; Streptophyta; Embryophyta; Iracheophyta;

CO Eukaryota, Magnoliophyta; eudicotyledons; core eudicots; rosids;

CO Eucosids II, Last sesicales; Brassicaceae; Arabidopsis.
-i- SIMILARITY: Belongs to the methyltransferase superfamily.
-i- CAUTION: Ref.1 sequences differ from that shown due to erroneous gene model prediction.

"Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FINCTION: Catalyzes N-methylation of phosphoethanolamine, phosphomonomethylethanolamine and phosphodimethylethanolamine, the three methylation steps required to convert phosphoethanolamine to phosphocholine.

CATALYTIC ACTIVITY: S-adenosyl-1-methionine + ethanolamine phosphate = S-adenosyl-1-homocysteine + N-methylethanolamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10-OCT-2003 (Rel. 42, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -: SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-:- SUMILARITY: Belongs to the methyltransferase superfamily.
-:- CAUTION: This protein is a fusion of the two annotated genes At3911990 and At3918000.
-:- CAUTION: Ref. 2 sequence differs from that shown due to erroneous gene model prediction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5.5%; Score 26; DB 1; Length 491;

The isolation and characterization in yeast of a gene for Arabidopsis S-adenosylmethionine:phospho-ethanolamine N-methyltransferase.";
Plant Physiol. 124:1800-1813(2000).
                                 Schneider M.;
Umpublished observations (WAY-2002).
Umpublished observations N-methylation of phosphoethanolamine,
-i- FUNCTION: Catalyzes N-methylation of phosphoethanolamine, the
phosphomonomethylethanolamine and phosphodimethylethanolamine to
three methylation steps required to convert phosphoethanolamine to
phosphocholine (By similarity).
-i- CATALYTIC ACTIVITY: Sadenosyl-L-methionine + ethanolamine
phosphate = S-adenosyl-L-homocysteine + N-methylethanolamine
                                                                                                                                                                                                                                                                                                                        -1- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).
-1- SINILARITY: Belongs to the methyltransferase superfamily.
-1- CAUTION: Ref.1 (RAGS1806) sequence differs from that shown due to erroneous gene model prediction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GBFR44; 091M1;

0

diphosphate.
-!- COFACTOR: FWN and NADPH (By similarity).
-!- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the IPP isomerase type 2 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              InterProj IPR001009; FNN enzyme.

Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3-
demethylubiquinone-9 = S-adenosyl-L-homocysteine + ubiquinone-9.
-!- PATHWAN: Ubiquinone biosynthesis.
-!- SIMILARITY: Belongs to the ubig/COQ3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3-
demechylubiquinone-9 = S-adenosyl-L-homocysteine + ubiquinone-9.
-!- PATHWAY: Ubiquinone biosynthesis.
-!- RATHWAY: Belongs to the ubiG/COQ3 family.
                                                                                                                                                                                                                                         Gaps

Nat. Biotechnol. 20:1118-1123(2002).

-! CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3-demethylubiquinnone-9 = S-adenosyl-L-homocysteine + ubiquinnone-9.
-! PATHWAX: Ubiquinnone blosynthesis.
-! SIMILARITY: Belongs to the ubiG/COO3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 236;

Screening method to obtain DNA encoding environmental stress resistance factor, useful for producing transgenic plants resistant to environmental

Claim 64; Page 125-127; 167pp; Japanese.

Polynucleotide sequences AAF74187 - AAF74218 encode proteins AAB80608 - AAB80639, which impart environmental stress resistance. The invention relates to a method for identifying DNA encoding proteins imparting environmental stress resistance. The method comprises inserting cDNA from a library originating in a salt-resistant organism into a host coll, coulturing the transformants under conditions in which the untransformed host does not grow well, and selecting for viable clones. The method is useful for öbtaining DNA encoding environmental stress resistance. The DNA encoding proteins conferring environmental stress resistance environments stress environmental stress environmental stress environmental stress.

plants cells

The present sequence is S-adenosyl-L-methionine:phosphoethanolamine N-methyl-transferase (FRAT) protein from spinach. The PEART sequences are phosphodimethyl-transferase (FRAT) protein from spinach. The PEART sequences are phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphodimethyl-tholine, choline-O-sulphate or glycine betaine. They are useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties of a plant and increasing the cryoprotectant properties of a plant and increasing the cryoprotectant properties of a plant and increasing transgenic plants with increased

```
environments such as deserts, salt damaged ground, cold regions and the oceans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the effects of the increase in atmospheric carbon dioxide concentration. PCR primers AAF74219 and AAF7420 are used in an example illustrating the method of the invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The present invention describes isolated tocopherol and carotenoid metabolism related proteins (TCMRP) [1] from mosses or algae.

microorganisms or fungi, plante, or itse fragments [1] can be used as enzymes in the production of fine chemicals or in the metabolism of tocopherols and carotenoids. [1] also assist in transmembrane transport.

The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and nucleotide bases.

Wulleotide sequences, proteins, vectors and host cells from the present invention can be used: [a) to identify mosses related to Physcomitrella patens; (b) in mapping genomes of mosses related to Physcomitrella patens; (c) in the medulation of functional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the cellular production of functions in AMH4422 to AMH4422 encode the AMH4421 to AMH4421 represent mucleotide sequence used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ... 121 NIVERMIKKLKEGGYIFFRESCFHOSGOPHKRKSNPTHYREPRFYTKAFKEGHLODGSGNS 180

The present sequence is S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase (PEAMT) truncated protein from spinach. The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphodimethylethanolamine, phosphomono-methylethanolamine, plosphomono-methylethanolamine, cells. The polymucleotides of useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties... of a plant. The present invention also relates to methods and comprising PEAMT used for generating transgenic plants with increased nutritional value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New plant S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase polypeptides, useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine and for altering the lipid content in plants cells.

                                                                                                                                                                                                      ô
barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences

The present invention describes isolated tocopherol and carotenoid metabolism related proteins (TCMRP) [1] from mosses or algae.

microorganisms or fungi, plants, or its fragments. [1] can be used as enzymes in the production of fine chemicals or in the metabolism of coopherols and carotenoids. [1] also assist in transmembrane transport. The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and nucleotide bases.

Wulledocide sequences, proteins, vectors and host cells from the present invention can be used: [3] to identify mosses related to Physcomirrella patens; [6] in the medulation of from acidity; [6] in emballation of from acidity; [6] in the determination of functional TCMRP regions; [7] and in the cellular production of functional TCMRP regions; [7] and in the cellular production of functional TCMRP regions; [7] and in the cellular production of functional TCMRP regions; [8] and in the AMH4412 to AAH44221 represent nucleotide sequence used in the exemplification of the present invention

microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis

(BIOT-) BIOTICA TECHNOLOGY LTD.

New DNA sequence encoding polyketide synthase, useful for the production of polyketides such as antibiotic monensin.

Claim 6; Page 73; 212pp; English.

The invention relates to a DNA sequence which is a fully defined sequence

```
cc of 103551 base pairs appearing as ABX04971, or its variant, that it is not as sequence encoding all or part amino acids 1-920 encoded by mon AI as given in the specification. The DNA is the S. cinnamonensis polyketide antibiotic monenal biosynthetic gene cluster. Also included are a creepforthant closing or expression vector comprising the gene cluster, a transformed host cell which has been transformed to contain the gene cluster (and is capable of expressing a corresponding polypeptide), a hydridization probe derived from the gene cluster, e.g. one which binds is specifically to a region of the monensin gene cluster, e.g. one which binds specifically to a region of the monensin gene cluster selected from mon BI, mon BI, mon CI, mon RI gene or variant and a monenain promoter to control expression of the monensin gene cluster selected from mon BI, mon BI, mon BI, mon BI, mon BI, mon RI, won RI, won AIX and monensin promoter to control expression of the monensin gene cluster (control expression of the monensin gene cluster of the monensis, a polypeptide encoded by a portion of the monensin gene cluster (control expression of the monensin gene enzyme encoded by mon CI, a cyclase enzyme encoded by mon CII, producing S. cinnamonensis capable of cyclase enzyme encoded by mon CII, producing S. cinnamonensis capable of cyclase enzyme encoded by mon CII, producing S. cinnamonensis capable copies of the mon RI gene. S. cinnamonensis containing multiple copies of the mon RI gene and/or its variants, expressing a gene neterologous con the conding a heterologous gene and expressing the gene under control of the activator gene mon RI or actIVorf4 and 13-propyl erythromycin A. The concading a neterologous gene and expressing the gene under control of activator gene mon RI or actIVorf4 and 13-propyl erythromycin A. The prosesses and materials (enzyme systems, nucleic acids and vectors) are useful for preparing polyketides are useful for the production of monensin, an antibiotic polysether. Monensin gene cluster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       monensin gene cluster

```
The present invention describes a substantially purified tocopherol protein (1). Also described is a method (M) for reducing expression of methyltransferase (GWT) in a plant. By transforming a plant with a mucleic acid molecule having an exogenous promoter region which functions in plant cells to cause the readention of an mRNA molecule, and growing the transformed plant. (M) is useful for increasing the gamma-tocopherol content. A polymucleotide (II) encoding (1) can be used for producing a plant having a seed with an incoding (1) can be used for producing a plant having a seed with an incoding the reduction of the expression, expression, overexpression of (1) in a transformed plant to provide tolerance to a variety of stress, or anidating the reduction of the expression, expression, overexpression of (1) in a transformed plant to provide tolerance to a variety of stress, c.g. orid tolerance, or fungal/microbial pathogen tolerance. (II) is useful to repeat the receipt of a genomic libraries, to isolated promoters of cell enhanced, cell specific, tissue enhanced, tissue specific, developmentally or environmentally regulated expression profiles, as markers, for detecting single nucleotide polymorphisms, and to determine the level of (1) in a plant or pattern of expression of (1) encoded in the level of (1) in a plant or pattern of expression of (1) encoded in invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           51 IEELLINWAGVQAAEDILDVGCGIGGSSLYLAQKFNAKATGITLSPVQAARATERALKANL 110

This invention relates to genes associated with the tocopherol
biosynthesis pathway. In particular, the invention relates to genes which
cencode proteins with a methyltransferase activity. Tocopherols are an
important component in mammalian dists increased intake of which results
in a decreased risk of cardiovascular disease and cancer and improved
immune function. Vitemin B, or alpha-tocopherol, is significant for human
health and is primarily synthesised by plants and other photosynthetic
corganisms. The present invention provides a nuclectide sequence which
corders a tocopherol methyl transferase 2 (2-methylphytylplastoquino)
methyltransferase; tht2) enzyme, wlich is a component of the tocopherol
corganisms. The present invention is useful in methods of
colypeptide having tht2 expression of a gene encoding a plant a
polypeptide having tht2 activity, producing a plant having a seed with
colypeptide having tht2 activity, producing a plant having a seed with
colypeptide having tht2 octopherol levels and producing a plant having a seed with
colypeptide having the coopherol levels. The nucleic acid molecule is useful in
colypeptide having the coopherol or vitamin B levels. The plants are
cold methyl enfancing food and feed sources. The nucleic acid is
nutritionally enhancing food and feed sources. The nucleic acid is
cold molecule or polypeptide is also useful for producing modified plants
with improved tolerance to a variety of stress, for example oxidative

Mitomycins are a group of natural products that contain a variety of functional groups, including amino benzoquinone and axiridine ring systems. The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the witosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g. antibiotics, anti-inflammatory agents, anti-cancer agents, immune-enhancers, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                  The invention relates to an isolated and purified nucleic acid molecule comprising a sequence having mitomycin biosynthetic gene cluster, or its variant or fragment. Also included are an expression cassette comprising the novel nucleic acid molecule (operably linked to a promoter functional in a host cell), a recombinant bacterial host cell in which at least a portion of a mucleic acid molecule comprising mitomycin biosynthetic gene cluster is disrupted (resulting in a recombinant host cell) that produces altered levels of mitomycin relative to a corresponding nonrecombinant bacterial host cell), introducing exogenous DNA into a refractory streptomycin strain, identifying a nucleic acid molecule that is related to at least a portion of a nucleic acid molecule comprising a mitomycin cell and a product produced by the recombinant host cell. The nucleic acid encodes a Mitz, Mitz
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               236 YERVFGPGYVSTG----GY-----ETTKBFVSM----LDLKPGQKVLDVGCGI 275

The present invention describes a substantially purified tocopherol protein (I). Also described is a method (M) for reducing expression of methyltransferase (fWT) in a plant, by transforming a plant with a nucleic acid molecule having an exogenous promoter region which functions in plant cells to cause the production of an mRNA molecule, and growing the transformed plant. (M) is custul for increasing the gamma-tocopherol content. A polymucleotide (II) encoding (I) can be used for producting a plant having a seed with an increased alpha-tocopherol content. A polymucleotide (II) encoding (I) can be used for producing a plant having a seed with an increased alpha-tocopherol or alpha-tocotrienol level. (II) is useful for modulating the reduction of the expression, expression, overexpression of (I) in a transformed plant to provide tolerance to a variety of stress, cold tolerance, or fungal/microbial pathogen tolerance. (II) is useful for cold tolerance, or fungal/microbial pathogen tolerance. (II) is useful for obtaining other nucleic acid molecules or homologues from the same coperion or detecting single nucleotide polymorphisms, and to detectance (C) markers, for detecting single nucleotide polymorphisms, and to detectance the level of (I) in a plant or pattern of expression of (I) encoded in the level of (I) in a plant or pattern of expression of (I) encoded in the part or whole by (II). The present sequence represents an Amabaena sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      207 LWQKVDSKDDKGPQRFLDTSQYKCN9ILRYERVFGP----GYVSTGGYBTTKEFVSMLDL 262

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 15
```

```
This invention relates to genes associated with the tocopherol
biosynthesis pathway. In particular, the invention relates to genes which
cncode proteins with a methyltransferase activity. Tocopherols are an
important component in mammalian dets increased intake of which results
in a decreased risk of cardiovascular disease and cancer and improved
immune function. Vitamin B, or alpha-tocopherol, is significiant for human
health and is primarily synthesised by plants and other photosynthetic
corganisms. The present invention provides a nucleotide sequence which
anothyltransferase) tht2) enzyme, which is a component of the tocopherol
corganisms. The present invention is useful in methods of
encodes a tocopherol methyl transferase (2 "methylphytylplastoquinol
methyltransferase) tht2) enzyme, which is a component of the tocopherol
corporating, in a plant, the expression of a gene encoding a plant
polypeptide having tht2 activity, producing a plant having a seed with
colypeptide having tht2 activity, producing a plant having a seed with
increased total tocopherol levels. The nucleic acid molecule is useful in
companient express high tocopherol or vitamin B levels. The plants are
cuseful in mammalian dist, particularly as animal feed, or for
nutritionally enhancing food and feed sources. The nucleic acid is
particularly useful for tocopherol biosynthesis in plants. The nucleic
cald molecule or polypeptide is also useful for producing modified plants
with improved tolarance such as variety of Etress, for example oxidative
collegance and oxygen or zone, uly tolarance such asserted and examples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 stress tolerance such as to oxygen or ozone, UV tolerance, cold tolerance, or fungal/microbial pathogen tolerance. The present sequence is the amino acid sequence of the Anabaana erecta gamma-tocopherol methyltransferase enzyme related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New genes associated with the tocopherol biosynthesis, and its encoded methyltzansferases, useful for producing transgenic plants and seeds expressing high tocopherol levels, which are useful as animal feed or nutritional enhancer.
                                            rocopherol methyl transferase 2; 2-methylpransferase; tWT2; transgenic plant; 2-methylphytyljastoquinol methyltransferase; tWT2; transgenic plant; transgenic seed; mammalian diet; animal feed; feed source; tocopherol biosynthesis; modified plant; oxidative stress tolerance; UV tolerance; cold tolerance; fungal pathogen tolerance; fungal pathogen tolerance; tMT2; enzyme; plant; gamma-tocopherol transferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Valentin HE, Van Eenennaam A;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
